

Building “serverless” Software with AWS Lambda

by Jonathan Knapp

What is “serverless”?

What is “serverless”?

It's a buzz word.

Um, if it's [#serverless](#) why am I getting an "IOError: No space left on device"?

What does “serverless” mean?

You get to rent engineers from Google, AWS, Pagerduty, Pingdom, Heroku, etc for much cheaper than if you hired them in-house — if you could even get them, which you probably can't because talent is scarce.

- Charity Majors

**Hi,
I'm Jon.**

VAGRANT

Can we make it easier?

Yes, we can.

DISCLOSURE QUEST

Beta

Quickly and easily search Form D and Reg

+ MORE OPTIONS

Recent **Reg A** Filings

DOG USA INC.

FLOWER INVESTMENT GROUP INC

OUNDFLOOR FINANCE INC.

aim L.A. Inc

Media Group | [Terms of Service](#) [Privacy Policy](#)

Create a custom search interface to the SEC's Reg A, Form C, and Form D filing information.

*Parse html & xml pages.
Avoid IP traffic restrictions.
Store information for searching.
Archive files to S3.*

RAILS

memegenerator.net

Project Goals

1. Know when errors occur
2. Handle spikes in traffic
3. Avoid IP blacklisting and play nice with Edgar servers
4. Small, focused codebase
5. Easy to maintain

Architecture Composition

- Lambda - Background and async job processing
- ElasticSearch - Data storage and search interface
- S3 - Storage and web hosting of archived form filings
- SES - Email notifications and support requests
- SQS - Queueing of data processing requests
- CloudWatch - Logging and monitoring
- Rollbar - Error logging and alerting
- DigitalOcean - Public website hosting

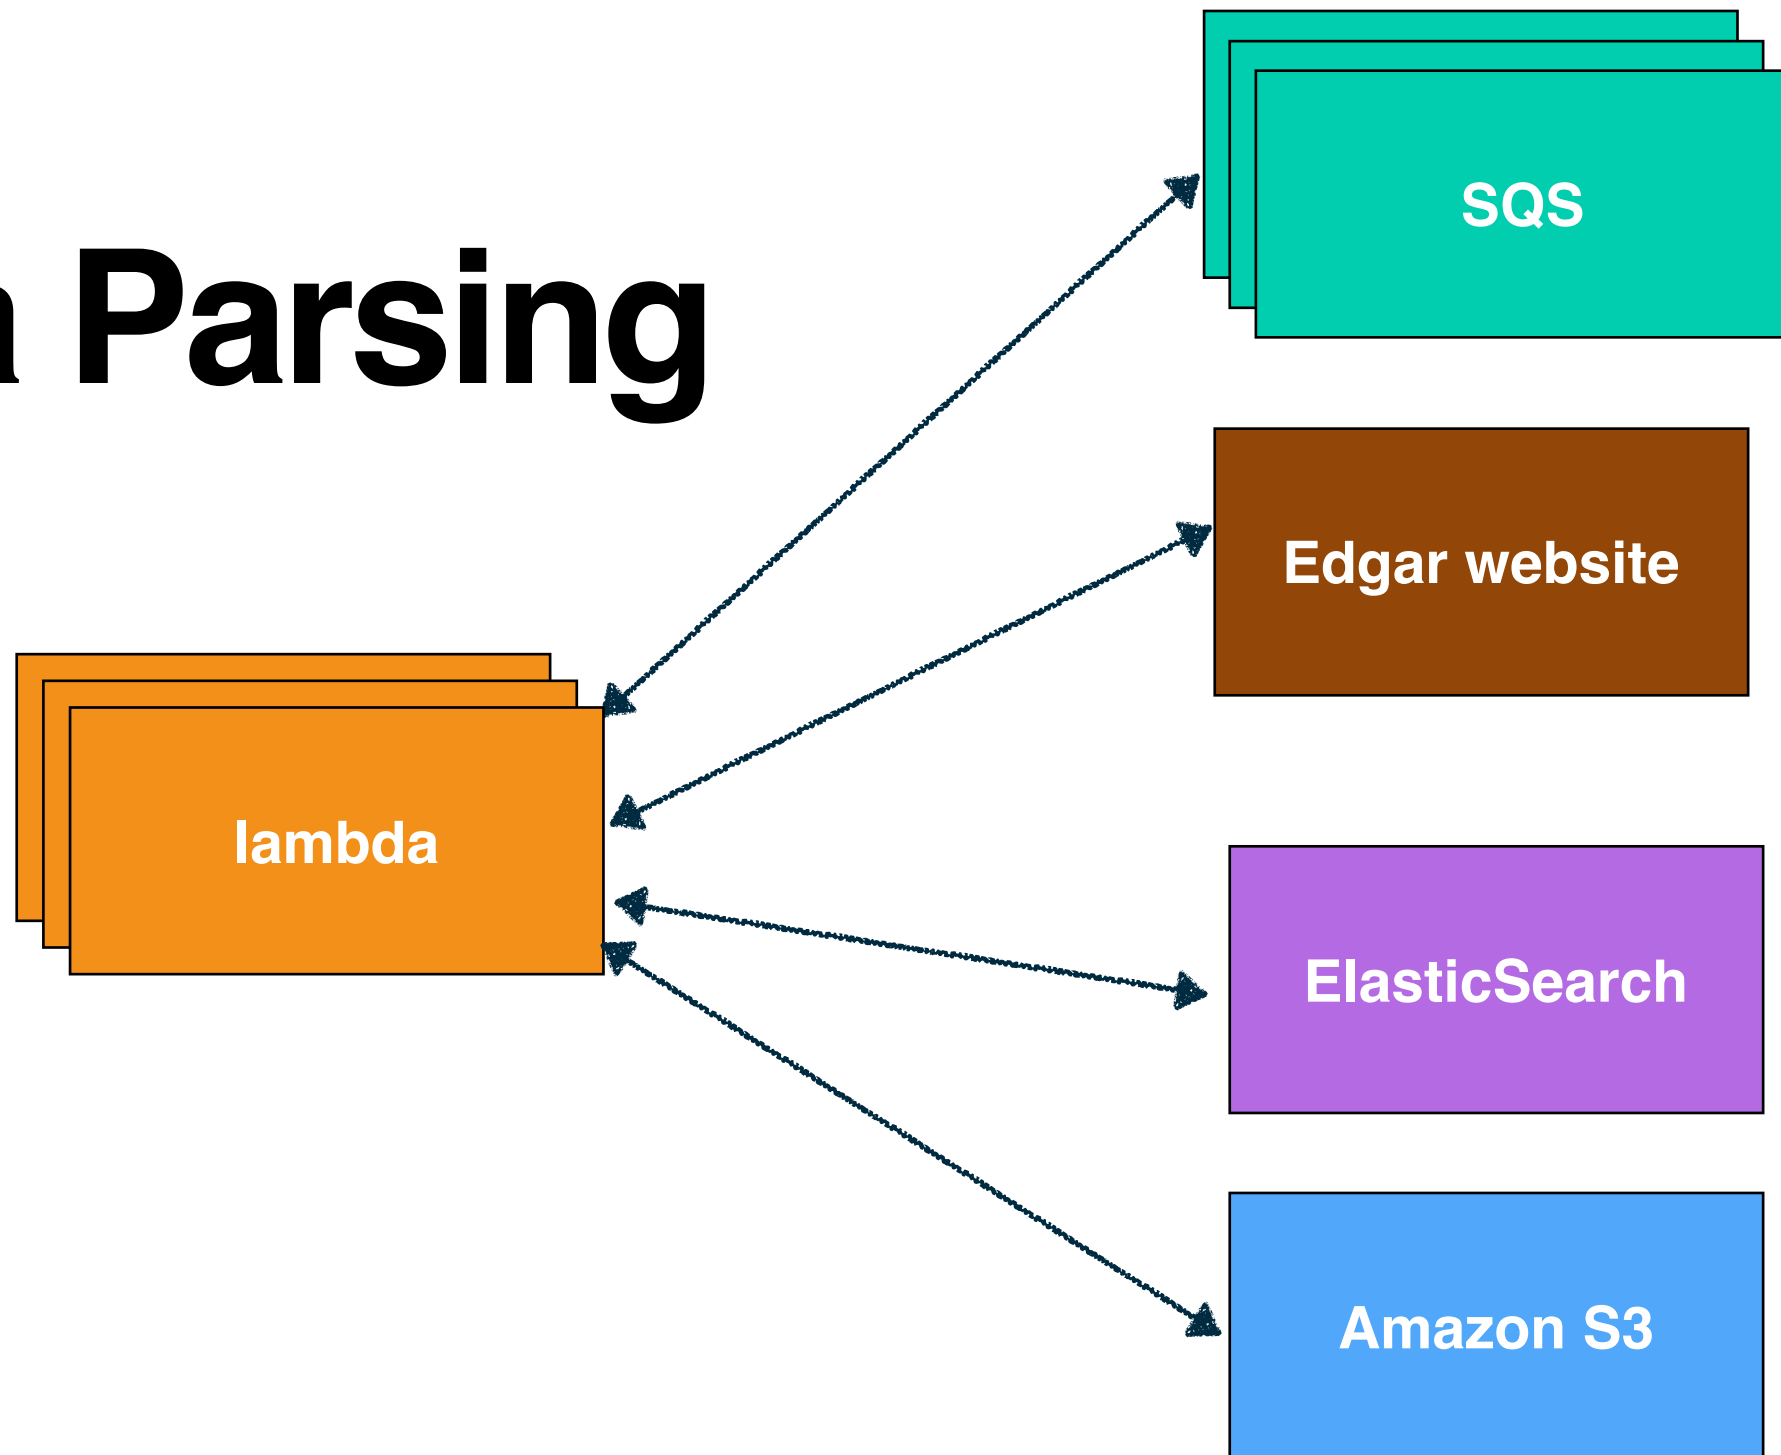

Data Parsing

1. Lambda job runs every 5 minutes
2. Request new filings from Edgar
3. Parse results and enqueue identifier for later processing
4. Processing Lambda jobs run via cron and pull items from queue for processing
5. Resulting data sent to Elasticsearch, files to S3
6. Remove items from queue
7. Errors logged and developers alerted

Data Parsing

Data Parsing

The Website

- Request data from ElasticSearch
- Render HTML pages

Success

We met our goals for the Disclose Quest project and were able to deliver an application that was easy to maintain, could scale automatically, and was easy to understand.

Other Project Examples

1. Use API Gateway to handle html form submissions.
2. Recreate website resources every X minutes, days, weeks,
3. Create one-off API endpoints without bloating your codebase.
4. Store / monitor 3rd party api web hook responses.

Buyer Beware

AlexMcConnell commented 10 days ago

It works on Serverless 4.2. It breaks on Serverless 5+. Serverless is just updating so fast that it's difficult to keep up with.

Tools To Go “serverless”

Apex
Zappa
Gordon
iron.io
Microsoft Azure

Lessons Learned

- Log vigorously
- Use error notification service or setup CloudWatch alerts
- AWS API Gateway could be much better
- API Gateway works with Swagger definition files (kind of)
- Think of you application as distinct parts
- Learn IAM roles and how to tie services together
